CORIOmaster firmware M412_0D

Released By: Neil Baptiste 17-Feb-23

The firmware update process has been changed to improve system stability and reliability.

New Features

- None

Fixed

- Custom EDIDs can now be loaded successfully.
- Improvements to the WebSocket packet handling, that was causing some disconnections.
- REST: AVIP ActiveQueue PLayItem command is now working.

Known Issues

- After exiting cloning and ch2 is then put back onto the Canvas – a black screen is seen instead of video. Layout shown as NULL in CORIOgrapher (During initial set up).

  Workaround is as follows:

  1. Hit Take before adding the second channel back to the canvas (after disabling cloning).
  2. If you end up in this state, then remove channel 2 from the canvas, hit Take, and then re-add channel 2 to canvas, hit Take again (Issue is a lot less likely to happen when in Immediate Mode).

- Keying menu is listed in window properties pane when no keying module is in system.

- Removing output from canvas shows resolution as NULL in CORIOgrapher for the output in the slots status page.

- The REST API command;
  http://{{serverIP}}/api/{{ApiVersion}}/system/comms/ethernet/restartethernet will crash the unit if the CPU does not have the new Real Time Clock module fitted. Workaround = power cycle.
